Week 6 – More Structured Query Language (SQL)

Read Chapter 7 again and then Chapter 8 (section 8.1 – 8.6)

Remember, that SQL is simple to read and understand – so reading someone else's written scripts is like a walk in the park – Really! It is that simple. But, the challenge lies in writing the scripts yourself.

The tables for creating these tables and loading of data are provided on Stream. Practice the SQL statements provided in the lecture slides. This will help you learn better, much more than just reading from the slides.

Business Rules for the Tutorial (Textbook)

1. A customer may generate many invoices. Each invoice is generated by one customer.
2. An invoice contains one or more invoice lines. Each invoice line is associated with one invoice.
3. Each invoice line references one product. A product may be found in many invoice lines
4. A vendor may supply many products. Some vendors do not supply products (yet to be approved)
5. If a product is vendor-supplied, that product is supplied by only a single vendor
6. Some products are produced in-house, i.e. they are not supplied by a vendor

Try creating virtual tables, virtual columns and different types of joins as has been explained in the screencast and lecture slides.

SQL can be fun and frustrating at the same time. It really makes you look hard at data relations, and how would be the best way of extracting relevant information.

So, get working with the given problem domain, before we start with PL/SQL next week.
